1 Gradient Descent

$$dC(\omega) = \lim_{\varepsilon \to 0} \frac{C(\omega + \varepsilon) - C(\omega)}{\varepsilon} \tag{1}$$

(2)

1.1 Derivitive Of One Parameter Function

Within the Twice example we described a model with one parameter - w

The formula had a form like this:

$$f(x) = x \cdot w \tag{3}$$

Function C which takes one parameter w is defined as:

$$C(w) = \frac{1}{n} \sum_{i=1}^{n} (x_i \cdot w - y_i)^2$$
 (4)

Let's compute the derivitive C' of our function:

$$C'(w) = (C)' \tag{5}$$

$$= \left(\frac{1}{n} \sum_{i=1}^{n} (x_i \cdot w - y_i)^2\right)' = \tag{6}$$

$$= \left(\frac{1}{n} \sum_{i=1}^{n} (x_i \cdot w - y_i)^2\right)' = \tag{7}$$

$$= \frac{1}{n} \left(\sum_{i=1}^{n} (x_i \cdot w - y_i)^2 \right)' =$$
 (8)

$$= \frac{1}{n} \sum_{i=1}^{n} \left((x_i \cdot w - y_i)^2 \right)' = \tag{9}$$

$$= \frac{1}{n} \sum_{i=1}^{n} (2 \cdot (x_i \cdot w - y_i)(x_i \cdot w - y_i)') =$$
 (10)

$$= \frac{1}{n} \sum_{i=1}^{n} (2 \cdot (x_i \cdot w - y_i) \cdot x_i)$$
 (11)

The final form of our derivitive:

$$C'(w) = \frac{1}{n} \sum_{i=1}^{n} (2 \cdot (x_i \cdot w - y_i) \cdot x_i)$$
 (12)

1.2 One Neuron Model With 2 Inputs

One neuron model is defined as:

$$z = \sigma(x \cdot w_1 + y \cdot w_2 + b) \tag{13}$$

 $x_1 \dots \text{input parameter}$

 $x_2 \dots$ input parameter

 $w_1 \dots$ weight paramter

 $w_2 \dots$ weight paramter

b... bias parameter

 $\sigma \dots {\rm sigmoid}$ activation function

1.2.1 Cost

Let's recall the Sigmoid activation function

$$\sigma(x) = \frac{1}{1 + e^{-x}} \tag{14}$$

$$\sigma(x)' = \sigma(x) \cdot (1 - \sigma(x)) \tag{15}$$

Let's define the cost function C for our model

$$a_i = \sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) \tag{16}$$

$$C(x) = \frac{1}{n} \sum_{i=1}^{n} (a_i - y_i)^2$$
(17)

Let's compute the derivitive C' for our function

We have to modify TWO parameters w, b

For this we will use PARTIAL DERIVITIVES this means that first we compute a derivitive in respect to w_1 , w_2 and then we compute another derivitive in respect to b

1. Partial Derivitive in respect to w_1

$$a_i = \sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{18}$$

$$\partial_{w_1} a_i = \partial_{w_1} (\sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{19}$$

$$= a_i(1 - a_i)\partial_{w_1}(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{20}$$

$$\partial_{w_1} a_i = a_i (1 - a_i) \cdot x_i \tag{21}$$

(22)

$$\partial_{w_1} C = \partial_{w_1} \left(\frac{1}{n} \sum_{i=1}^n (a_i - z_i)^2 \right) =$$
 (23)

$$= \frac{1}{n} \sum_{i=1}^{n} \partial_{w_1} \left((a_i - z_i)^2 \right) = \tag{24}$$

$$= \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \partial_{w_1} (a_i - z_i) =$$
 (25)

$$= \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \partial_{w_1} a_i =$$
 (26)

$$\partial_{w_1} C = \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i) \cdot x_i \tag{27}$$

(28)

2. Partial Derivitive in respect to w_2

$$a_i = \sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{29}$$

$$\partial_{w_2} a_i = \partial_{w_2} (\sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{30}$$

$$= a_i(1 - a_i)\partial_{w_2}(x_i \cdot w_1 + y_i \cdot w_2 + b) =$$
 (31)

$$\partial_{w_2} a_i = a_i (1 - a_i) \cdot y_i \tag{32}$$

(33)

$$\partial_{w_2} C = \partial_{w_2} \left(\frac{1}{n} \sum_{i=1}^n (a_i - z_i)^2 \right) =$$
 (34)

$$= \frac{1}{n} \sum_{i=1}^{n} \partial_{w_2} \left((a_i - z_i)^2 \right) = \tag{35}$$

$$= \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \partial_{w_2} (a_i - z_i) =$$
 (36)

$$= \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \partial_{w_2} a_i =$$
 (37)

$$\partial_{w_2} C = \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i) \cdot y_i$$
 (38)

(39)

3. Partial Derivitive in respect to b

$$a_i = \sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) \tag{40}$$

$$\partial_b a_i = \partial_b (\sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) = \tag{41}$$

$$= a_i(1 - a_i)\partial_b(x_i \cdot w_1 + y_i \cdot w_2 + b) =$$
 (42)

$$= a_i(1 - a_i) \cdot 1 = \tag{43}$$

$$\partial_b a_i = a_i (1 - a_i) \tag{44}$$

$$(45)$$

$$\partial_b C = \partial_b \left(\frac{1}{n} \sum_{i=1}^n (a_i - z_i)^2 \right) = \tag{46}$$

$$= \frac{1}{n} \sum_{i=1}^{n} \partial_b ((a_i - z_i)^2) =$$
 (47)

$$= \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \partial_b (a_i - z_i) =$$
 (48)

$$=\frac{1}{n}\sum_{i=1}^{n}2\cdot(a_i-z_i)\partial_b a_i =$$

$$\tag{49}$$

$$\partial_b C = \frac{1}{n} \sum_{i=1}^n 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i)$$
 (50)

(51)

To summarize the parial derivitives are:

$$a_i = \sigma(x_i \cdot w_1 + y_i \cdot w_2 + b) \tag{52}$$

$$\partial_{w_1} C = \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i) \cdot x_i$$
 (53)

$$\partial_{w_2} C = \frac{1}{n} \sum_{i=1}^{n} 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i) \cdot y_i$$
 (54)

$$\partial_b C = \frac{1}{n} \sum_{i=1}^n 2 \cdot (a_i - z_i) \cdot a_i (1 - a_i)$$
 (55)

(56)
